

Advantages to the farmer

1. They have a demonstrable rapid and wide spectrum of activity. This activity has been independently verified in field and laboratory trials.
2. The Product is conveniently available in the form of safe, rapidly soluble effervescent tablets for simple disinfection of farm water, surfaces and equipment.
3. By incorporation into a biosecurity control programme, they will help to prevent livestock infections and reduce safety issues in compliance with HACCP system requirements.
4. The Aquasept and Seprivet range is easy and non-hazardous to transport and to handle (does not spill or leak) and takes up far less storage space than liquid products.
5. In-use dilutions are easily understood and achieved.
6. Unlike many other disinfectants, and particularly chlorine products, Aquasept and Seprivet have great stability : 3 years in unopened tubs.
7. Cost of in-use dilutions is easily evaluated and is inexpensive. In addition, there are further cost benefits due to reduced waste (liquids can be overdosed, whereas dosing with tablets is exact) and reduced staff time(in measuring out liquids, or evaluating dosage requirements and dilutions).
8. They have consistent quality and reliable strengths. Liquids are produced to various strengths and compositions. This inconsistency is difficult to incorporate in an effective infection control programme.
9. The derivatives of the active ingredient of Aquasept and Seprivet(isocyanurate) are relatively non-toxic and are biodegradable in the environment.
